

Report of the Brazilian Committee for Phase Diagrams of Materials 2023 APDIC Meeting (2021 highlights)

Highlights:

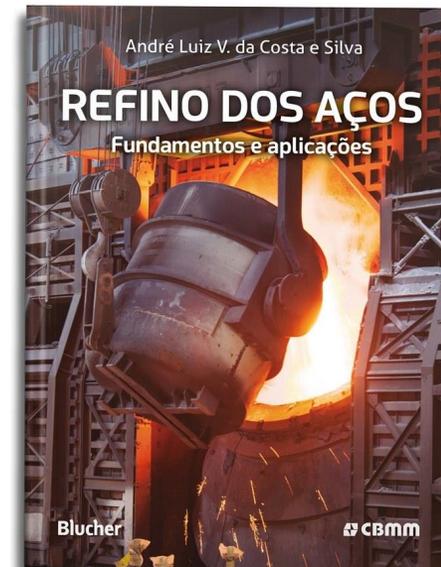

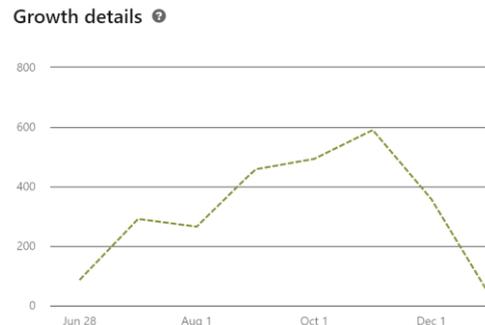

2022 ABM Week Conference was a great success, large number of participants and contributions.
Technical Coordinators: A.Costa e Silva, F Beneduce, A Vilela.

2023 Two Workshops on Computational Thermodynamics: foreseen for late 2023.

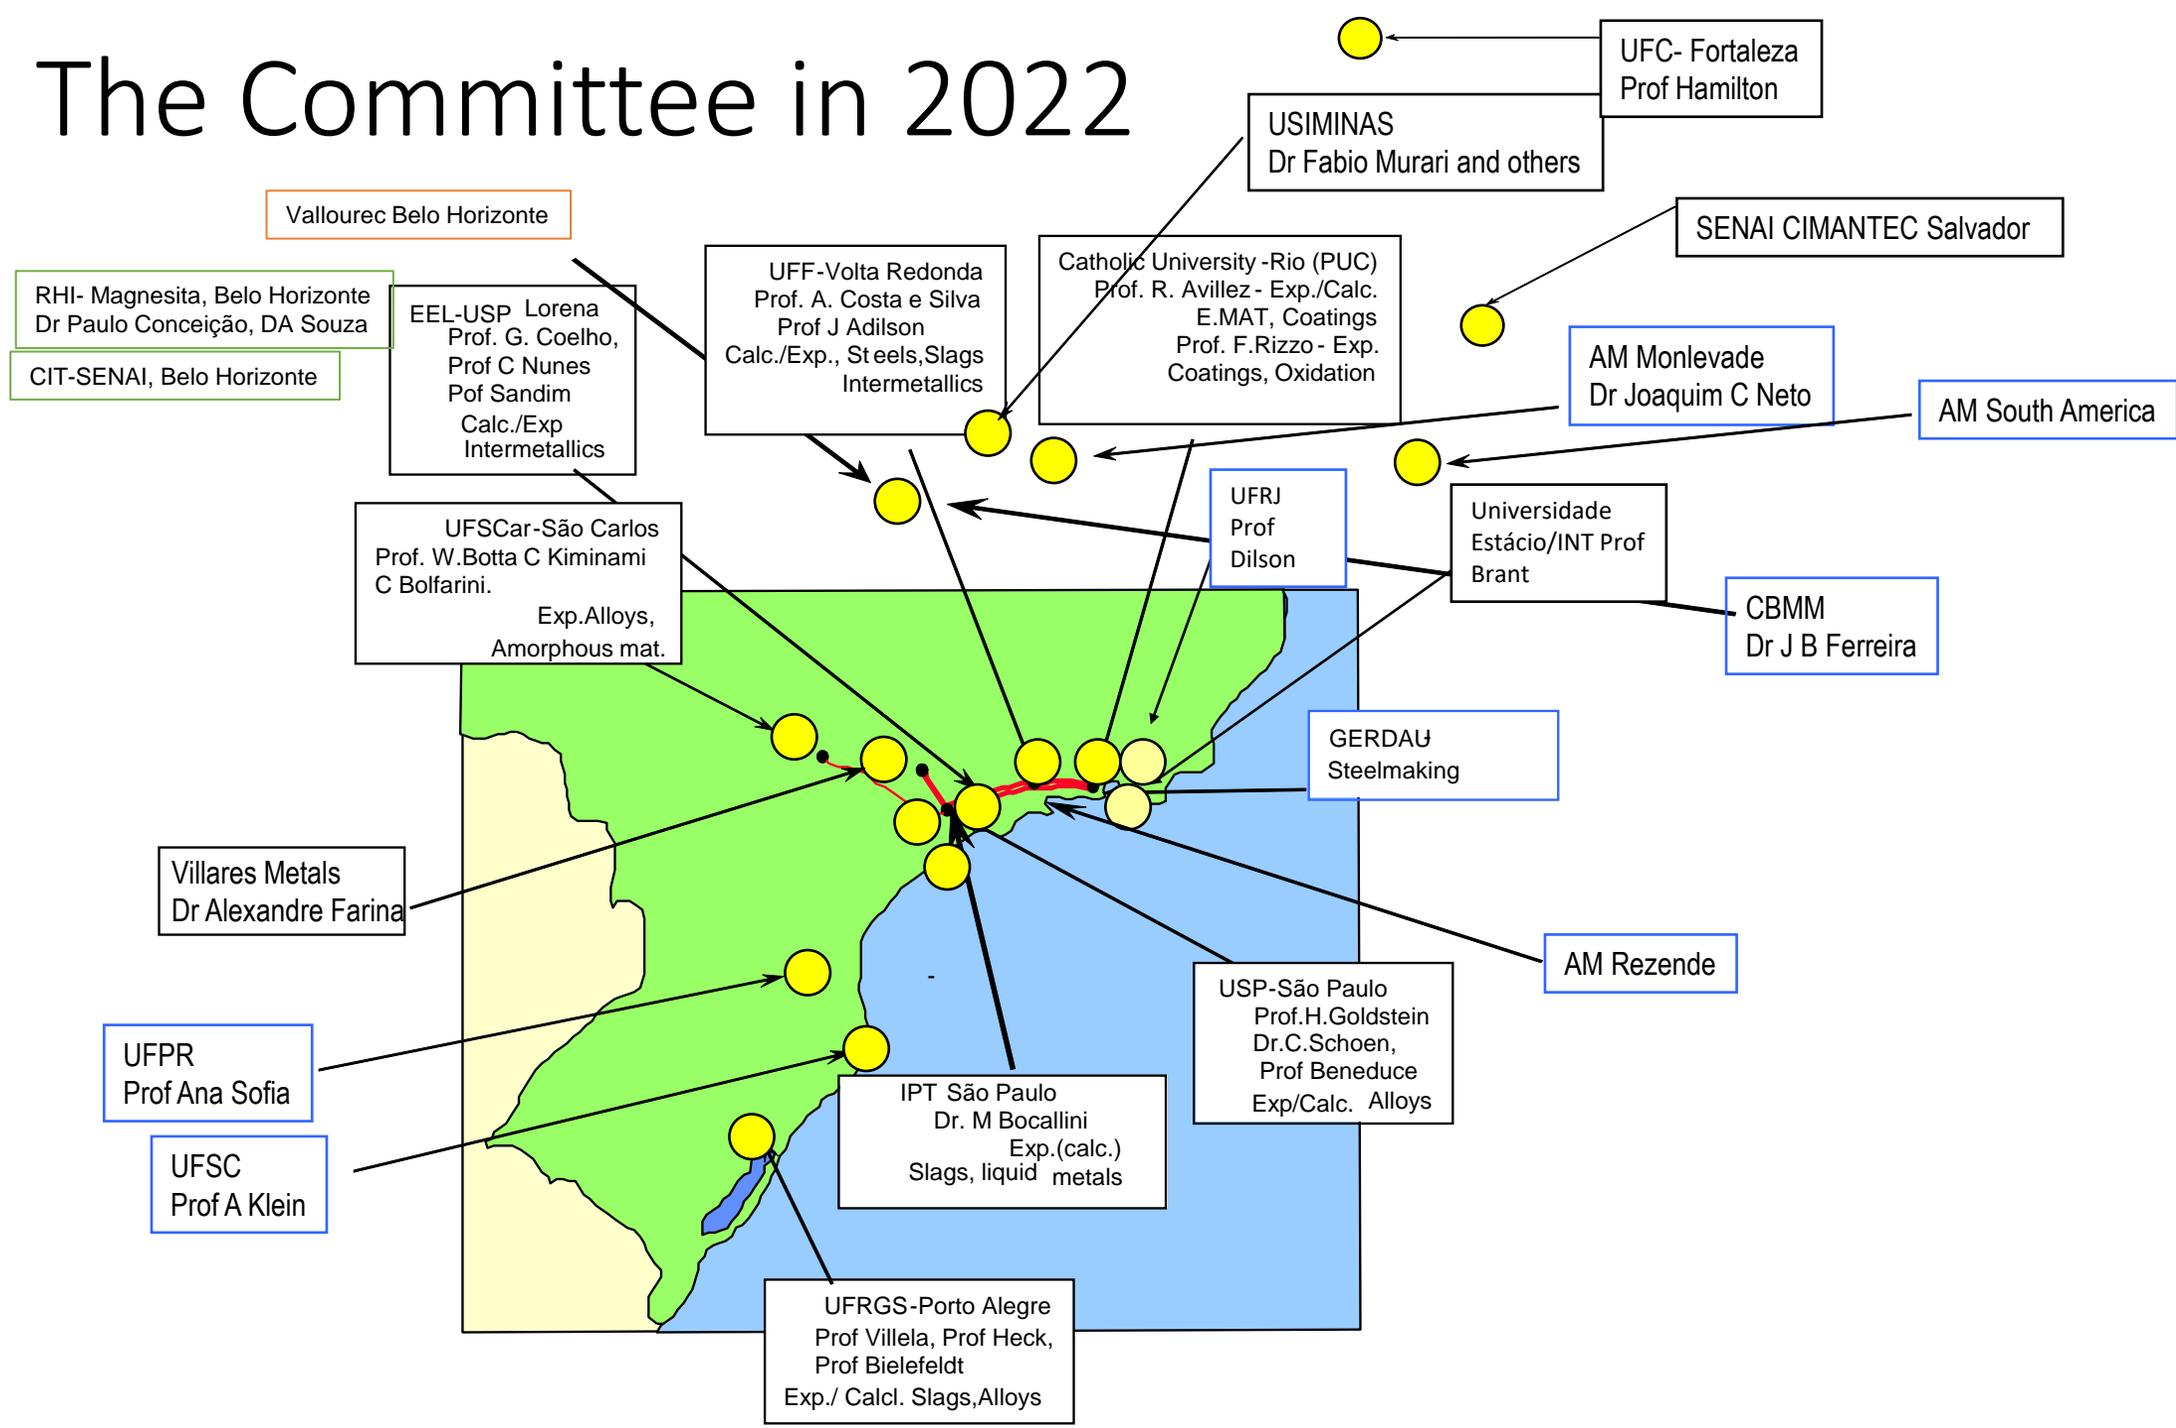

Organizing 2023 ABM Week. Very large number of presentations and participants (>1600)

Prof A Costa e Silva book on Steelmaking published.

Usual activity in Linkedin Phase Diagram Group

The Committee in 2022

Organization	Researchers	Pub's	Highlights
UFSC-Florianópolis, Santa Catarina	Prof Klein +7, 7PhD, 16MSc +10	+10	controlled wear material, advanced materials for compressor, nanostructured materials. Diffusion and diffusive formation of new materials
UFMG	Prof Wictor Wolf		HEA, Metallic glasses, novel materials
UFSCar, São Carlos SP	Prof Botta, Kiminami, Bolfarini +15	+20	Novel materials, advanced glasses, HEA, borides, low density steel
USIMINAS- Ipatinga, MG	4		Flat steel development. Pipeline, pressure vessels, automotive. DP, HSLA. Slag development, de-P, converter modeling, clogging control in continuous casting
UFRJ- Rio de Janeiro, RJ	Prof Dilson, L Henrique, Leonardo group Prof Payão's group		Hydrogen in materials, oil & gas materials Welding research and simulation, superalloy diffusion and welding, additive manufacturing
USP – São Paulo, SP	Prof Schoen's group Prof Goldstein, Beneduce, Tschiptin		First principles, high entropy Steels, advanced materials, Superalloys. Diffusion modeling in advanced alloys
USP- Lorena, SP	Prof G Coelho, C Nunes, H Sandim +	15	Boron in steel, silicides and other high temperature materials
Vallourec- Belo Horizonte, MG			Steels for sour service, advanced steels
Villares Metals- Sumaré, SP	Dr. A. Farina +5		Development of Ni and Fe based advanced alloys. Solidification, transformation modeling, continuous casting process improvements, database for Ni containing slags.

Organization	Researchers	Pub´s	Highlights
ArcelorMittal Monlevade, MG	8+9 Dr Joaquim Gonçalves	3	Spring steel cleanness,hardenableity. Quenching+distortion control
ArcelorMittal South America (ES)			Environmentally sound steelmaking – Seminar and studies
ArcelorMittal Rezende (RJ)	3, Iury Otaviano	1	B in steel
APERAM, Timóteo, MG	3		Stainless and electrical steel.
CIT-SENAI , Belo Horizonte, MG	2		Precipitation in microalloying steel. Thermodynamics, kinetics and experimental
UNIFEI, São Bernardo, SP	10 Prof Magnabosco		Diffusion and phase transformations in stainless steels. CALPHAD best poster award 2021!
IPT São Paulo, SP	9		
RHI-Magnesita Belo Horizonte, MG	5		Refractory materials development; Slag-Refractory interactions; Inclusion Control and Clean Steel Making; Slag Thermophysical properties
PUC-Rio de Janeiro RJ	Prof Rizzo´s group Prof Avillez´s group	7	Prof Rizzo back in PUC and in the CGEE Research in AHSSsteels Prof Avillez working on molecular dynamics
SENAI CIMANTEC Salvador BA	Dr. Bruna Callegari, Dr. Tiago Lima,		Prof. Dr.-Ing. Rodrigo Coelho, Dr. Luis Fernando Folle, Paulo dos Reis (MSc.), Prof. Dr.-Ing. Rodrigo Coelho Materials development: Cast Al alloy Ferroalloy dissolution in steel
GERDAU			Specialty Steels: non-metallic inclusions, heat treatment
TERNIUM Steelmaking, SantaCruz, RJ	Ricardo Vieira Regis De Almeida Martins, Lorenzo Engel Fornasari, Raissa Santos Salgado, Bruno Suveges Cerchiari		Process development and investigation in melt shop
UNESP- Itapeva SP	Prof Baldan		HEAs computational thermodynamics
UFC- Fortaleza, Ceará	Prof Hamilton +2	7	Maraging steels and high strength materials. Interaction with new steel mill
UFF, Volta Redonda RJ	Prof A. Costa e Silva + Prof J Adilson Prof P.R.Rios group	9 7	Steels and steelmaking. Prof André officially retired in 2022. Work with steel industry continues Kinetics of steelmaking with computational thermodynamics
UFPR- Curitiba, Paraná	Prof Ana Sofia +1		Additive manufacturing
UFRGS - Porto Alegre, RS	Prof Vilela, Bielefeldt, Heck	9	Steelmaking, reduction and environment, Steelmaking slag and processing courses. Prof Wagner Bielefeldt
UFSC-Florianópolis, Santa Catarina	Prof Klein +7, 7PhD, 16MSc +10	+10	controlled wear material, advanced materials for compressor, nanostructured materials. Diffusion and diffusive formation of new materials
UFMG	Prof Wictor Wolf		HEA, Metallic glasses, novel materials

PARTNERSHIP

The Effect of Boron on Low Carbon Steel

Author: Iury Otaviano

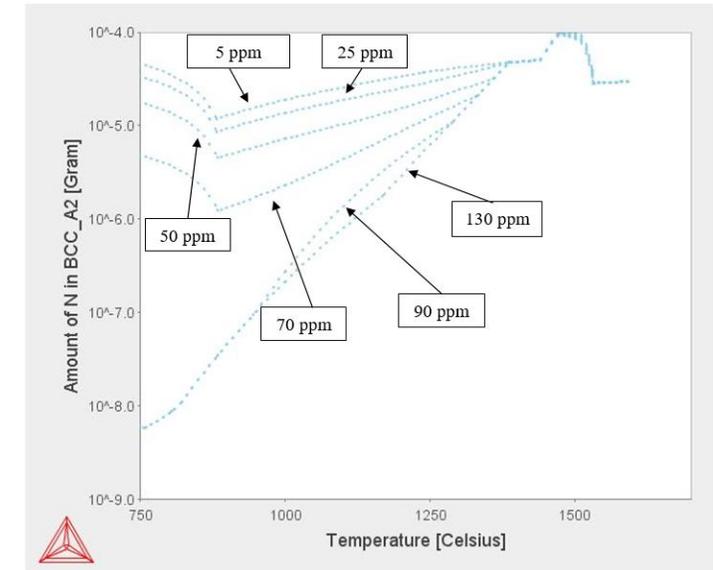

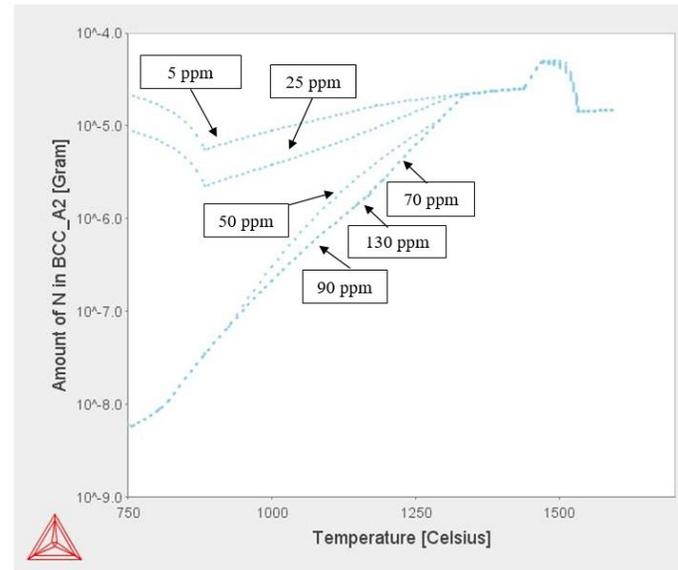

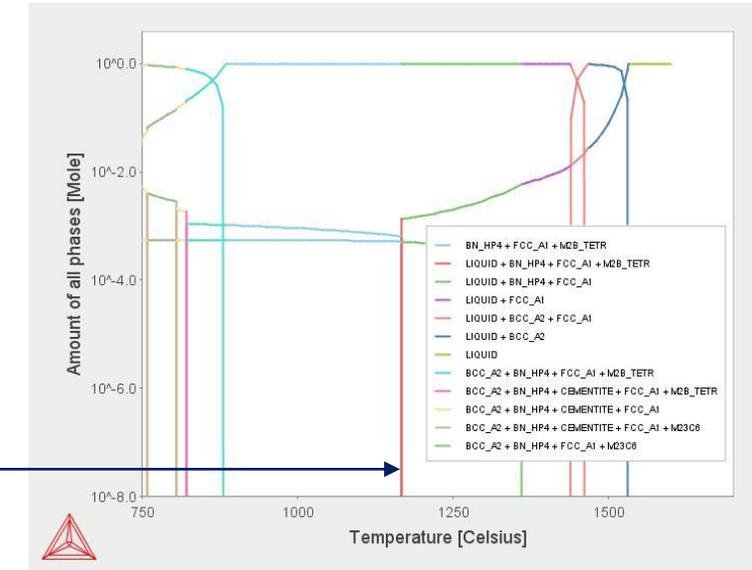

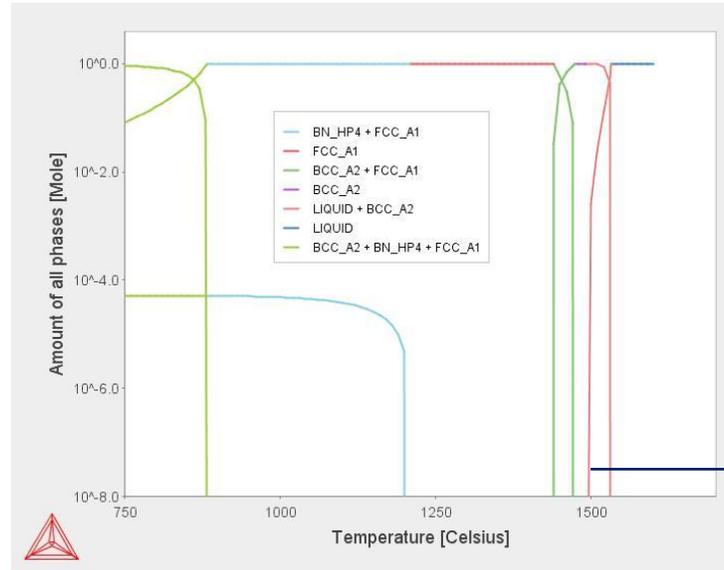

Organization Name: Arcelormittal

Team: Pedro Coutinho / Bruno Veiga

Team Size: 3

Advisor: André Costa e Silva

At Resende plant to minimize the aging effect on low carbon steels we have a boron addition in order to create boron nitride. The usage of boron have to be very well controlled because of his negative effects at the continuous casting machine. To better understand this effects we used thermodynamics computations. With some simple computations we could understand the effect of boron on the solidification shell. It was possible to notice that, as the relationship between boron and nitrogen grows a compound with boron and iron with low melting point is created and the solidification will finish in lower temperatures. We could also evaluate what was the best relationship between boron and nitrogen using the amount of Nitrogen remaining at BCC for different amounts of boron

Gerdau Specialty Steels Brazil (Pindamonhangaba Plant)

Control of Liquid Inclusion Window for SBQ Steels

Team: **Marcelo Carboni**, **Marcos Vinicios Garcia Neves**, **Marivaldo Junior Oliveira**, **Eduarda Zangrandi**, **Henrique Morales Zaggo**

Highlights: Calculation of liquid inclusion window (Holappa model) for all steel grades to be cast on the new continuous casting machine. Offline Mapping of a set of liquid inclusion windows using macro processing on FactSage covering all typical conditions during the refining stages of each steel grade. Based on these calculations, development of a statistical model for calculation of CaSi injection to achieve liquid inclusions for each steel grade on real time, during the production of the heat. More than 80 different steel grades were cast with this model: zero occurrences of clogging.

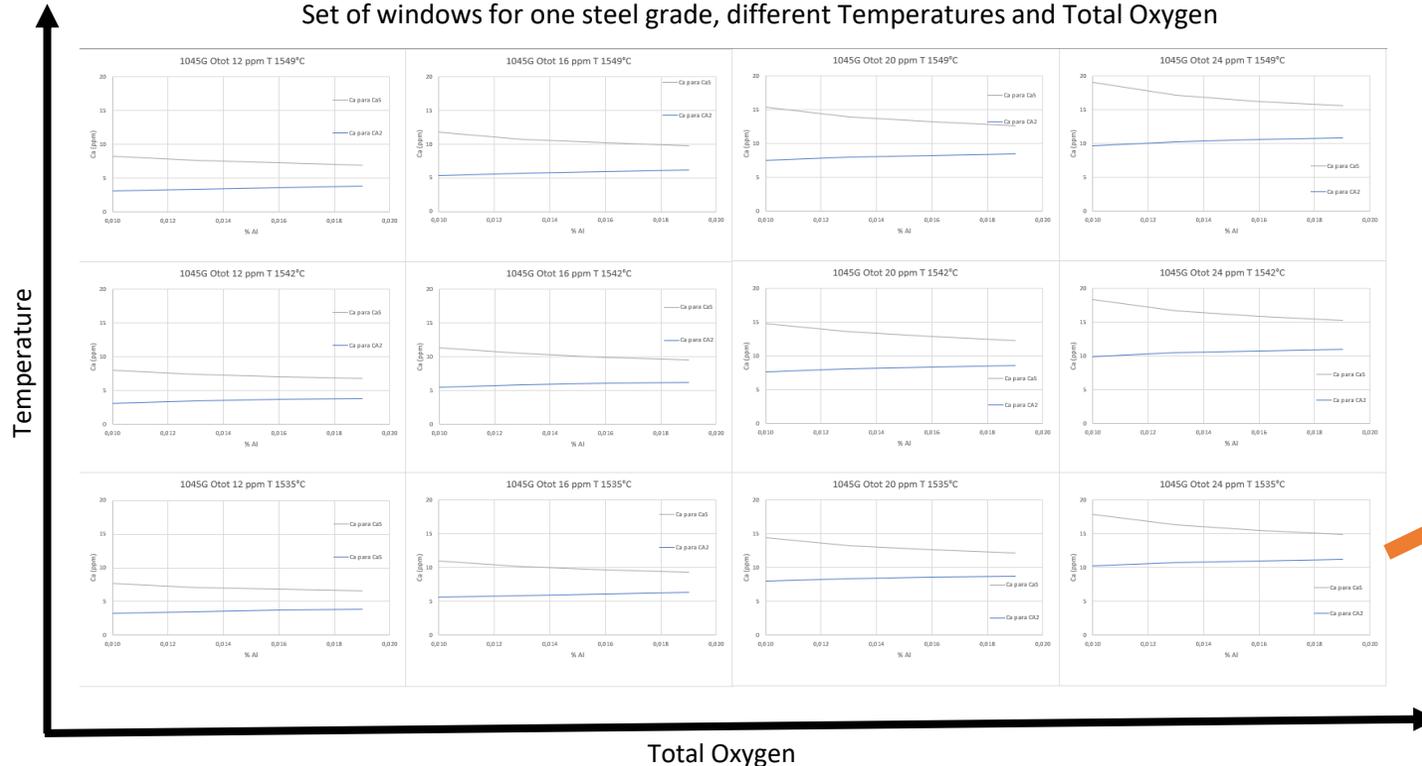

Collaborations:

Bruno Laidens (RHI): template for liquid window calculation

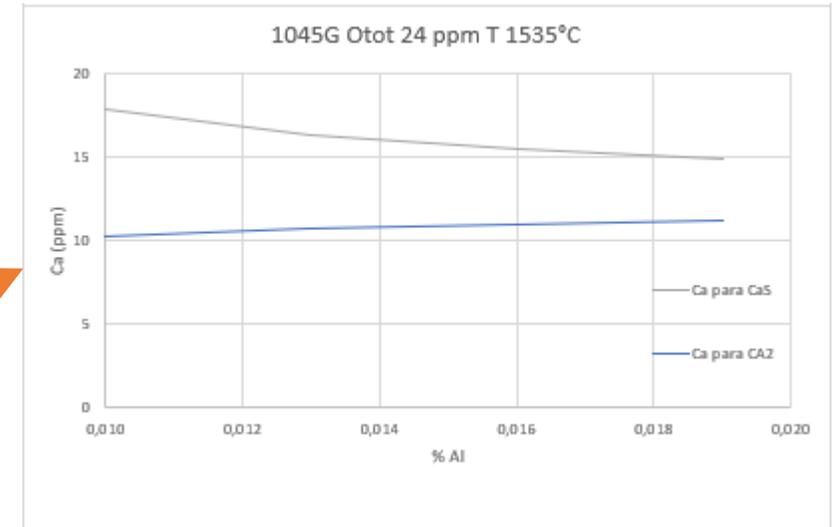

Prof. Wagner Bielefeldt (UFRGS – Federal University of Rio Grande do Sul): template for liquid window calculations and FactSage training of the team.

Prof. Marie-Aline Van Ende (Seoul National University): Webinar on Macro processing and contacts via LinkedIn for questions.

Set of windows for one steel grade, different Temperatures and Total Oxygen

Single windows for one steel grade, fixed Temperature and Total Oxygen (previous solution)

Gerdau Specialty Steels Brazil (Pindamonhangaba Plant)

Refining Slag Monitoring and Control

Organization: Gerdau Specialty Steels Brazil (Pindamonhangaba Plant)

Team: **Marcelo Carboni, Bruno Laidens (RHI), Marcos Vinicius Garcia Neves, Marivaldo Junior Oliveira, Eduarda Zangrandi**

Highlights: Evaluation of refining slags on ladle furnace and vacuum degassing, aiming for the protection of refractories (MgO saturation), optimizing C/S and C/A relations to guarantee inclusion cleanliness and control of viscosity of the slag. Daily report analysing all production heats from previous day (offline, using macro processing of FactSage) Adjument of slag recipes and practices.

Colaborations:

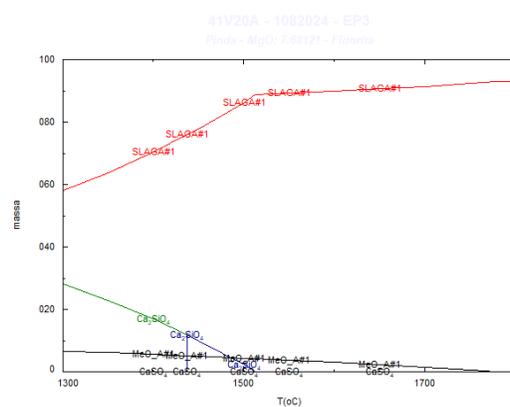

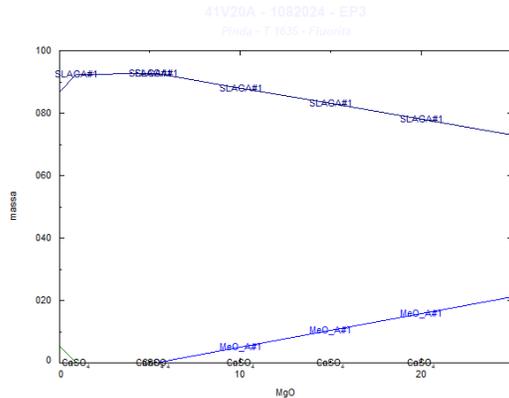

Prof. Wagner Bielefeldt (UFRGS – Federal University of Rio Grande do Sul): template for slag calculations and FactSage training of the team.

Prof. Marie-Aline Van Ende (Seoul National University): Webinar on Macro processing and contacts via LinkedIn for questions.

***Modeling Nb(C,N)
precipitation kinetics after the
roughing of thick plates***

- **Project:** Modeling Nb(C,N) precipitation kinetics after the roughing of thick plates
- **Participants (10):** Ricardo N. Carvalho⁽¹⁾; Neice F. Santos⁽¹⁾; Cynthia S. B. Castro⁽¹⁾; Clélia R. Oliveira⁽¹⁾; Anderson C. Jesus⁽¹⁾; Ronaldo Barbosa⁽³⁾; Paulo Haddad⁽²⁾; Ed J. M. Taiss⁽²⁾; Daniel B. Matsubara⁽²⁾; André L. V. Costa e Silva⁽⁴⁾
- **Organizations:** (1) CIT-Senai; (2) CBMM; (3) Gerdau; (4) UFF
- **Publications:** only internal reports by now, a paper is being written
- **Highlights:** Nb(C,N) precipitation kinetics was modeled by ThermoCalc/Prisma to support decisions on physical simulations by Gleeble and industrial experiments. The main goal was to adjust processes parameters (furnace temperature and waiting time after roughing) to maximize the amount of Nb in solid solution available for finishing steps. Both decreasing waiting time and temperature showed efficient to prevent Nb(C,N) precipitation after roughing and, therefore, increasing the driving force for strain induced precipitation at finishing steps and/or interphase precipitation during final cooling.

Calibration of $\gamma(t)$

Validation of $\gamma(t)$

Calibration: 0,17C; 0,0110N; 0,040Nb steel, $d\gamma = 250 \mu\text{m}$ (Le Bon et al.)

Valiation: 0,063C; 0,0058N; 0,084Nb steel, $d\gamma = 25 \mu\text{m}$ (Watanabe et al.)

Casting aluminum alloys: Alloy design

- Institution: SENAI CIMATEC – Integrated Campus for Manufacture and Technology (Salvador, Ba, Brazil)
- Main team: Dr. Bruna Callegari, Dr. Tiago Lima, Prof. Dr.-Ing. Rodrigo Coelho
- Full team size (from management to research): 07
- Problem: automotive cast aluminum alloy design for property optimization
- Employed Thermo-Calc tools:
 - DICTRA and PRISMA modules; TCAL8 and MOBAL7 databases
 - Equilibrium calculations, hot tearing susceptibility calculation, Scheil simulation (conventional and back-diffusion), simulation of phase dissolution, simulation of isothermal precipitation (aging)
- Outcome: new alloy with improved strength (+18%)

Study of dissolution behavior of ferroalloy

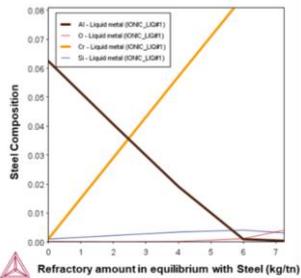

- Institution: SENAI CIMATEC – Integrated Campus for Manufacture and Technology (Salvador, Ba, Brazil)
- Main team: Dr. Bruna Callegari, Dr. Tiago Lima, Dr. Luis Fernando Folle, Paulo dos Reis (MSc.), Prof. Dr.-Ing. Rodrigo Coelho
- Full team size (from management to research): 07
- Problem: need to understand dissolution behavior of ferroalloys with varying granulometries in molten steel
- Employed Thermo-Calc tools:
 - Thermo-Calc 2023a (incl. DICTRA module); TCFE12 and MOBFE7 databases
 - Equilibrium calculations, Scheil simulation (conventional and back-diffusion), simulation of particle dissolution, simulation of homogeneization heat treatment
- Ongoing project

Non-contamination related chromium pick-up in RH degasser: Chromium based refractory ternary phase diagrams, thermodynamic and kinect analysis

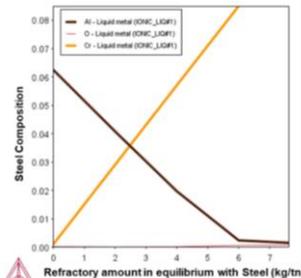

The problem

- Cr pick-up in RH vessel in ULC steels with Si > 0,3%
 - Fenômeno não ocorre para UBC convencional
 - Exauridas as possibilidades do Cromo vir de contaminação
 - Foi investigado pelo Thermocalc o efeito do Si no Refratário do Vaso, que contêm 20% de Cromita

UBC + 0,3% Silicon

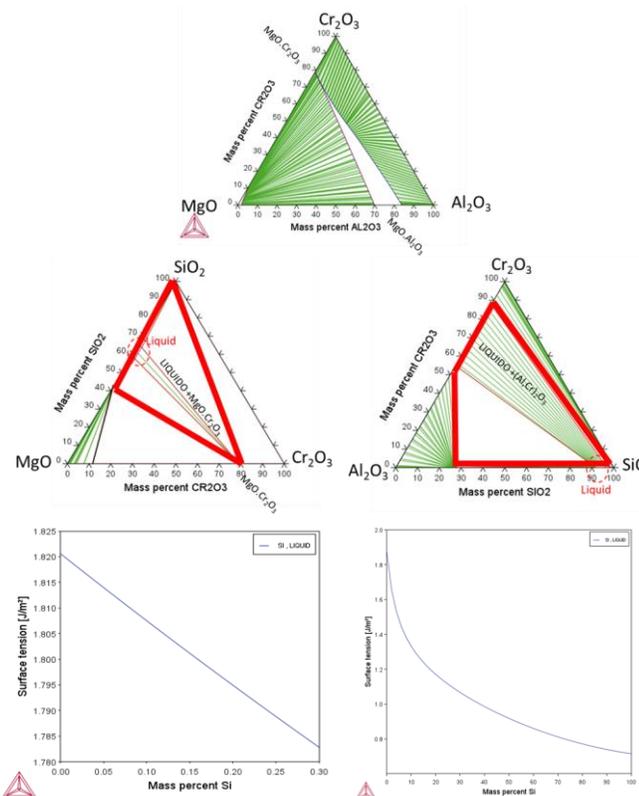

UBC

- Pelo Thermocalc Viu-se que a Cromita não é Estável para ambos os sistemas
- Iniciou-se a investigação do efeito catalizador do Silício

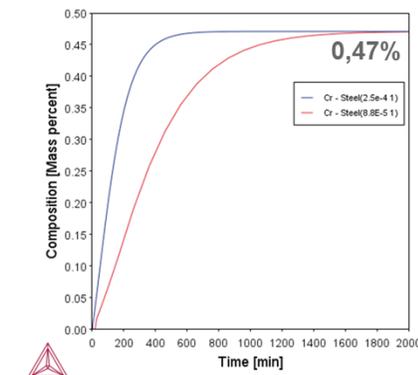

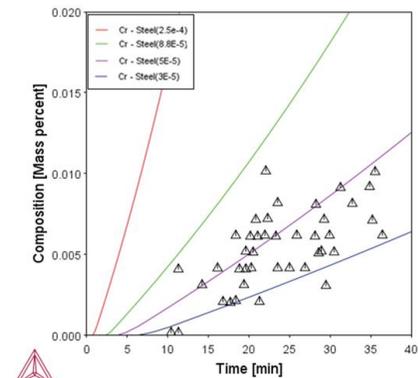

Analysis

- Análise das fases do Refratário a 1600° C antes e após interação com o Silício
 - Formação de fases líquidas
- Aumento da Área de contato Aço-Refratário com a adição de Silício

Solution

- Previsão do Pick-up por modelamento do transporte de Massa
- Sucesso no Controle da Composição Química

Works in Progress

- Development of new Ni-based and Fe-based alloys using thermodynamic simulations with Thermo-Calc software. TCFE12, TTNI8 and TCNI12 thermodynamic databases and its validation with experimental tests (DTA, DSC, Dilatometry).
- Kinetic simulations using DICTRA for Fe-based and Ni-based alloys to predict heat treatments and phase transformations.
- Simulations of the solidification process with dedicated software coupled with thermodynamic data extracted from Thermo-Calc software using TCFE12 and TTNI8 thermodynamic databases.
- Definition of parameters for continuous casting process using data from thermodynamic simulations with Thermo-Calc software coupled with SLAG4 and TCFE12 database.
- Thermodynamic modeling of slag/metal reactions for non-metallic inclusions control and process optimization using Thermo-Calc software coupled with TCFE12, SLAG4 and TTNI8 thermodynamic databases.
- Thermomechanical modeling of rolling and forging process of alloys with dedicated software coupled with thermodynamic simulations of alloys using Thermo-Calc software and TCFE12 and TTNI8 thermodynamic databases.

Unesp Itapeva/SP

Main researcher: Renato Baldan

Team: 5

Highlights: Research on HEAs using computational thermodynamics. Collaboration with UFSJ (Universidade Federal de São João del Rei), UNICAMP-Limeira, USP.

Witor Wolf – Professor of the Metallurgical and Materials Department – Federal University of Minas Gerais.

Researchers involved:

-PhD students: Maria Helena Teles Lopes, Miguel Leite Lapér

-Master's students: Luiz Paulo Mendonça e Silva (defended), Guilherme Cardeal Stumpf (defended), Alisson Silva Winther.

-Undergrad students: Arthur Diniz Silveira (defended), Thiago Cezar Drumond de Oliveira (defended), Nicassio Silva Franca, Abraao Fonseca Martins, Julia Santos Hobl, Pablo de Souza Miguel.

-Collaborators: Prof. Roberto Braga Figueiredo (UFMG), Prof. Dagoberto Brandão Santos (UFMG), Prof. Eduardo Henrique Martins Nunes (UFMG), Prof. Marcelo Araújo Câmara (UFMG), Prof. Eric Marchezini Mazzer (UFSCar), Prof. Francisco Gil Coury (UFSCar), Prof. Guilherme Yuuki Koga (UFSCar), Prof. Guilherme Zepon (UFSCar), Prof. Walter José Botta Filho (UFSCar), Prof. Claudemiro Bolfarini (UFSCar), Prof. Claudio S. Kiminami (UFSCar), Prof. Jan Schroers (Yale University).

In the last 5 Years we have been developing quasicrystal-forming Al-based alloys and High Entropy Alloys. Most of our work makes use of thermodynamic calculations for predicting phase formation in the alloys that we fabricate. We often associate the use of Calphad with tools for predicting high resistant alloys, by use of precipitation, grain size control and solid solution strengthening.

We have been able to accurately use High Entropy alloys databases for predicting phase formation and stability as well as for selecting alloying additions to promote carbide precipitation that has shown to be promising for grain growth control during thermomechanical processing of these materials. The thermodynamic calculation of quasicrystal-based alloys are more challenging due to lack of appropriate databases.

UFRJ

- Professors: Dilson Silva dos Santos; Leonardo Sales Araujo; Luiz Henrique de Almeida
- Areas of Research
- **Microstructural evolution of cast, high temperature steels for pyrolysis furnaces (HP steels):** the cast HP steels operate under high temperature ($> 900^{\circ}\text{C}$) for long periods (> 10 years) and its microstructural evolution through time can influence its creep properties. Important alloying additions, like Nb and Ti, improved its properties and slowed degradation, but it is important to have better knowledge of the phases formed and its transformations.
 - - Phase diagrams and isopleths;
 - - Step cooling phase formation;
 - - precipitation;
 - - Scheil calculations;
- **Phase formation during weld of austenitic clads:** the austenitic clads can be deposited over ferritic steels for protection against corrosion and hydrogen embrittlement for offshore applications. However, due to the thermal cycle and compositional gradients, it is key to investigate the phases formed over different conditions (kinetic and thermodynamic)
 - - Phase diagrams and isopleths;
 - - Step cooling phase formation;
 - - Solidification (Scheil calculations);
 - - Diffusion;
- **Alloying influence and phase transformation in superalloys:** nickel-base superalloys are complex materials, congregating various alloying elements that provide its remarkable properties. However, an improper control or processing can promote brittle phases formation and degradation of properties.
 - - Phase diagrams and isopleths;
 - - Solidification (Scheil calculations);
 - - Step cooling phase formation;
 - - Precipitation;
- **Titanium alloys for biomedical applications:** titanium alloys are candidate materials for biomedical components like stem prosthesis. However, the alloying is very limited to elements that promote no harm to the human body. At the same time, it is important to control phases formations to tailor mechanical properties.
 - - Phase diagrams and isopleths;
 - - Step cooling phase formation;

UFF - Andre Costa e Silva

Uso dos softwares FactSage e Thermo-Calc:

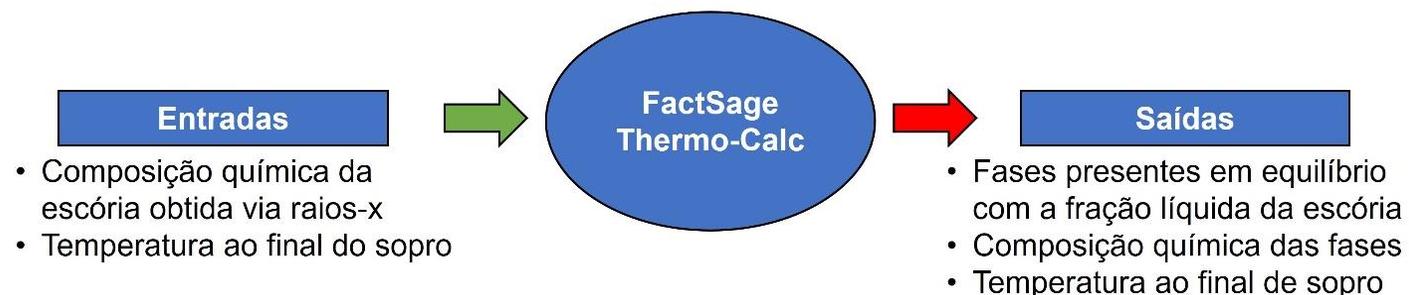

- Auxiliar os processo de produção de aços de baixo e ultra baixo fósforo;
- Verificar o distanciamento que os processos se encontram do equilíbrio termodinâmico;
- Auxiliar na modelagem termodinâmica do processo.

Publicações

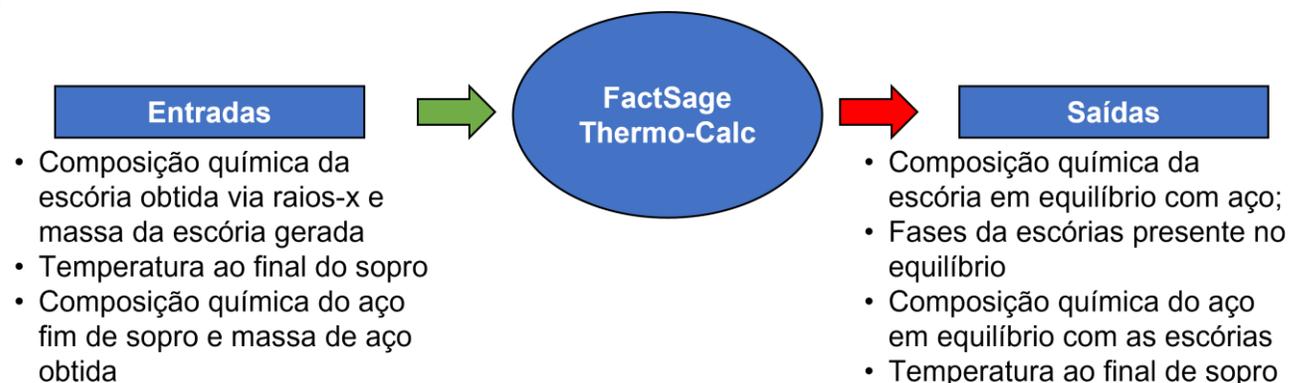

1. EVALUATION OF PHOSPHORUS PARTITION AT THE END OF BLOW IN LD CONVERTER (ABM WEEK – 2023)
2. PHOSPHOROUS PARTITION AT THE END OF BLOW IN BOF STEELMAKING – A THERMODYNAMIC STUDY OF P DISTRIBUTION BETWEEN SLAG AND METAL AND WITHIN THE SLAG (CALPHAD -2023)
3. DISSERTAÇÃO MESTRADO – WERNER AREDES MATOS / DESFOSFORAÇÃO EM CONVERTEDORES DO TIPO LD: UMA ANÁLISE VIA TERMODINÂMICA COMPUTACIONAL E MODELAGEM DO PROCESSO (PREVISÃO DE DEFESA ATÉ AGOSTO DE 2023).

Tipos de simulações

Determinação das fases sólidas em equilíbrio com as escórias ao fim do sopro nos convertedores:

Determinação do equilíbrio termodinâmico

The use of FactSage and Thermo-Calc software:

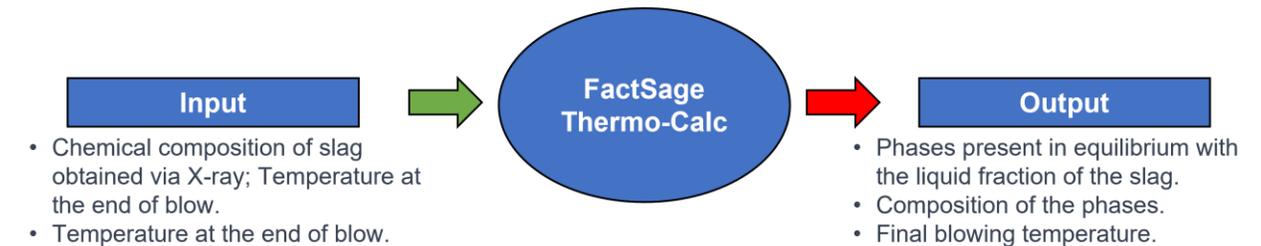

1. To assist in the production processes of low and ultra-low phosphorus steels;
2. To assess the deviation of the processes from thermodynamic equilibrium;
3. To support thermodynamic modeling of the process.

Publications:

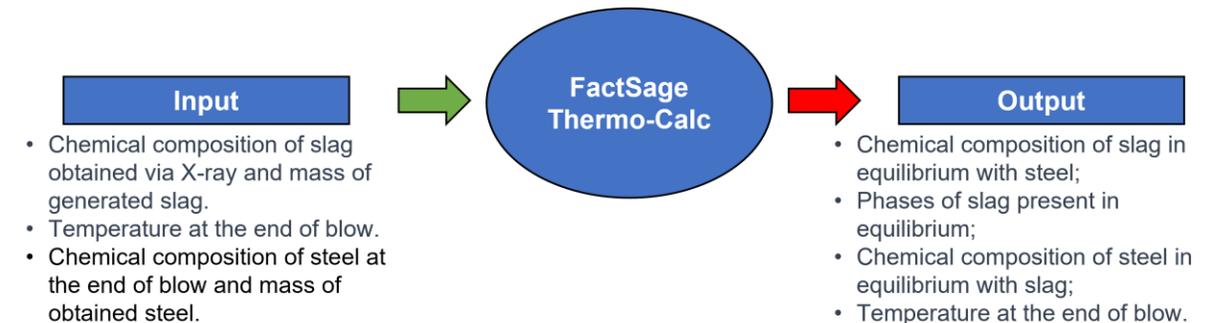

1. EVALUATION OF PHOSPHORUS PARTITION AT THE END OF BLOW IN LD CONVERTER (ABM WEEK – 2023)
2. PHOSPHOROUS PARTITION AT THE END OF BLOW IN BOF STEELMAKING – A THERMODYNAMIC STUDY OF P DISTRIBUTION BETWEEN SLAG AND METAL AND WITHIN THE SLAG (CALPHAD -2023)
